

The answer to genetic blindness begins with a CLEAR VISION.

Do you know someone living with extremely poor visual acuity? Extreme light sensitivity resulting in daytime blindness? Complete loss of color discrimination? **If so, they may have a rare inherited retinal disorder called Achromatopsia (ACHM), that causes blindness.**

AGTC, a biotechnology company, is sponsoring two clinical trials to evaluate an investigational gene therapy in subjects with ACHM caused by mutations in the CNGB3 or CNGA3 genes.
